

CREDESCENCE ANNUAL RYEGRASS

A TETRAPLOID WITH EXCELLENT RUST RESISTANCE

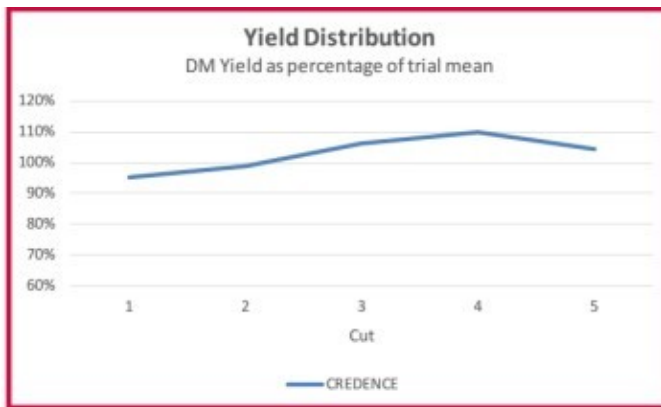

Credence is a tetraploid annual ryegrass developed for improved plant health and persistence. It is known for:

- Superior plant health and vigor
- Excellent late season production
- Fast regrowth
- Late maturity, maintaining high forage quality

Cold tolerance was used as an additional selection criterion in the final development. This trait makes Credence recover faster after an unexpected cold spell.

The result is a very high yielding, high quality tetraploid annual ryegrass. The dry matter production of Credence increases towards the end of the season. This is expressed in the yield distribution graph, DM production as percentage of trial mean:

This makes Credence very suitable for providing forage later in the season when earlier varieties start transitioning out, extending the length of the grazing season.

Multiple trial average, DLF, MS State University 2012/2013.

At A Glance

- Excellent for overseeding and mechanical harvesting
- Very rust resistant
- Later maturity—maintains high forage quality

Best Uses

Grazing, Haylage, Baleage

Establishment

Seeding rate: 35-40 lbs/A

Depth: 1/4"

Planting dates: Late summer to early fall
