

SOUTHERN BROADCASTER

This small-seeded mixture contains only species that broadcast well and is ideal for the equipment or topography limited farmer. **Annual ryegrass, crimson clover, daikon radish, and barkant turnips** come together for lush spring growth. Excellent for grazing and baleage, but not recommended for dry hay. Seed in early fall for maximum benefit from the legumes and brassicas.

Mixture Components

Ryegrass

Produces a massive, fibrous root system, tolerates traffic and provides quality yield in spring through early summer.

Crimson clover

Fixes nitrogen and is high in crude protein in early to mid-spring.

Daikon radish

Fights soil compaction and mines for nutrients deep in the soil.

Forage turnip

A grazing tolerant, bulbous brassica that brings together the benefits of a taproot with better regrowth.

Key Features

- Offers great diversity for spring growth.
- Contains clover that fixes nitrogen and boosts protein

Establishment

- **Seeding Rate:**
25-30lbs/acre
(Broadcasted)
- **Depth:** Surface to 1/4"
- While broadcasting is recommended, the seeds still need contact with the soil.

Testimonials:

"Broadcaster looks great.
Turnips above the knees."
- Paul Chaffin
